

QA BUG REPORT: #MAP-AUTH-01

Marija Trajković | Professional QA Portfolio

STATUS	APPROVED (uTest)
SEVERITY	HIGH (Technical)
OS/DEVICE	Windows 11 / Chrome
PROJECT	Automotive Inventory Management System

Summary

Google Maps authentication failure: Map rendering fails when navigating through vehicle inventory filters, resulting in a generic "Oops! Something went wrong" error message within the map container.

Results Analysis

- **EXPECTED RESULT:** The map should load and display vehicle locations correctly for all search results, regardless of the filters applied or the user's navigation history.
- **ACTUAL RESULT: Authentication Failure.** The map container is replaced by a placeholder error message indicating an API authentication issue.

Steps to Reproduce

1. Navigate to the vehicle inventory website.
2. Enter a specific Zip Code (e.g., 90210) and initiate the search.
3. Select a vehicle and verify that the map loads correctly initially.
4. Navigate back to the search results page.
5. Change the Zip Code filter to a different value (e.g., 90048).
6. Select a different vehicle from the updated results and observe the map.

Technical Impact

This is a critical technical defect that prevents users from accessing location-based services. The "AuthenticationFailure" status indicates a misconfiguration or expiration of the API key, which directly impacts the usability of the inventory platform and user trust.
