

QA BUG REPORT: #PRIVACY-DATA-01

Marija Trajković | Professional QA Portfolio

STATUS	APPROVED (uTest)
SEVERITY	HIGH (Privacy / Data Leak)
OS/DEVICE	Android 16 / Samsung Galaxy A53 5G
PROJECT	Public Transportation & Navigation App

Summary

User data isolation failure: Personal saved locations ("Home" and "Work") remain visible and accessible in the application even after logging out the first user and logging in with a completely different Google account on the same device.

Results Analysis

- **EXPECTED RESULT:** After switching accounts, the application should clear the cache and locally stored data of the previous user. The new account should start the session with empty fields or data exclusively linked to that account.
- **ACTUAL RESULT: Data Leak.** Saved addresses of the previous user remain displayed in the interface of the newly logged-in user.

Technical Note: Status: *IsolationFailure*. Personal location data is not cleared between sessions, representing a significant privacy risk on shared devices.

Steps to Reproduce

1. Launch the navigation application and grant all necessary location permissions.
2. Enter and save two arbitrary addresses in the "Home" and "Work" fields.
3. Access the application settings and log in using **Google Account 1**.
4. Log out from the first account.
5. Immediately log in using **Google Account 2** on the same device.
6. Check the "Home" and "Work" fields on the main application screen.

Technical Impact

This defect indicates a systemic failure in **Session Management** and **Local Cache** isolation.

Since user locations are sensitive data, the fact that the application "mixes" them between different authenticated sessions directly violates user privacy and can lead to unauthorized access to private information on shared devices.
